POWERED BY ARGOS99

Resiliency Intelligence Assessment (RIA)

Know what your business needs to survive and prove it can come back.

The most expensive number in cybersecurity is an unattainable RTO

The recovery time on file often bears little relationship to the recovery time in practice. An organization carrying a 48-hour objective can be down for weeks if targets were never tested against the environment expected to deliver them. That distance between commitment and capability is a recoverability gap. The RIA was designed to find yours, put a measurement on it, and hand you the plan that closes it. A tabletop exercise proves your team can talk through a crisis. The RIA proves your environment can survive one.

The assessment runs on your live environment

Argos99 goes live in your environment. The assessment runs on live evidence from your infrastructure, your backups, and your identity systems instead of questionnaires and recollection, so every finding is grounded in your real environment.

Your leaders and our recovery veterans sit at the same table. Your team makes the calls only the business can make, such as which functions the company cannot pause. Our advisors bring the judgment that only 500+ ransomware recoveries can produce, such as which systems attackers destroy first and what that does to a restore timeline.

Your posture gets tested against your own targets. Together we define your Minimally Viable Enterprise (MVE), the set of systems and applications your business cannot operate without. We then measure your backup architecture, dependencies, and identity conditions against your stated RPO and RTO commitments. The model reflects how ransomware events unfold rather than a clean outage.

What you walk away with

A defined MVE gives every decision an anchor. Once the business knows the systems it cannot operate without, every recovery and resilience decision that follows organizes around them.

Your recovery objectives become defensible. Targets get tested against the conditions Argos99 surfaces, so a shortfall appears in a conference room months before it could appear in a crisis.

You get a verdict on backup survivability. Threat actors destroy backups as standard procedure. The RIA establishes your real ability to restore from your own data instead of negotiating for it.

A prioritized roadmap leaves the room ready to execute. Remediation is sequenced by business impact, from immutability fixes to identity hardening, and built to run with Fenix24's Resiliency Operations Center (ROC).

Argos99 delivers continuous visibility into your recoverability, measured and validated every day.
